Excerpt from The Balancing of Engines During the last ten years the subject of Engine Balancing has gradually forced itself upon the attention of Marine Engineers, chiefly because the unbalanced periodic forces of the engine and the natural periods of vibration of the hull have mutually approached the sensitive region of synchronism. Electrical Engineers have had vibration troubles at Central Stations and on Electric Railways, and many cases of undue wear and tear and hot bearings in Mills and Factories undoubtedly arise from unbalanced machinery, though the actual vibration produced may not be great. In general, the running of an unbalanced engine or machine provokes its supports to elastic oscillations, and adds a grinding pressure on the bearings, and the obvious way to prevent these undesirable effects from happening is to remove the cause of them, that is to say, balance the moving parts from which the unbalanced forces arise. The balancing of the marine engine and the peculiar problems connected therewith have been investigated by many engineers, and most of the original papers on the subject are to be found in the Transactions of the Institution of Naval Architects. The gradual introduction of the Yarrow-Schlick-Tweedy system of balancing the reciprocating parts of an engine amongst themselves.
